EVR PRODUCTIONS / REFERENCE-LED REVISION / 7 OCTOBER 2026

Two references.
One original EVR experience.

This document records the public-site analysis, the design decisions it changes, and the plan used to revise the client-facing layout. The earlier dark concept was based on the chat and quotation reference, not these websites. The current revision supersedes that visual direction.

> **Central recommendation:** combine The Big Day's wedding storytelling, visible process and self-serve quotation entry with GCS's service organisation, content-production portfolio and business brief. Use a light, spacious EVR identity with distinct wedding and corporate accents. Do not merge every feature or service from both companies.

1. Research scope and evidence

Source	Inspected surfaces	Evidence boundary
The Big Day by Chai	Rendered homepage, navigation, media-card composition, proof/process/FAQ sections; wedding library; public quote-builder landing and initial step; process page.	Visible public UI and content. The lead-gated quote flow was not submitted. Later wizard steps, actual quote accuracy, private dashboard and app operations were not independently verified.
Geela Creative Space	Rendered homepage, service overview, reels/work/testimonial/client sections; content-production detail; work index; project contact form.	Visible public UI and fields. No enquiry was submitted and no business performance claim was verified. Case-study buttons were observed, not every underlying project inspected.

The supplied Google links resolved to the domains above. Rendered pages were used because simplified text fetching returned sparse or generic fallback content on several routes. Some media requests failed in the research browser; no complete media-playback, performance, accessibility or backend audit is claimed.

2. The Big Day: detailed design and journey analysis

Visual system

- Light, near-white canvas with soft warm/pink colour around the hero; ample whitespace rather than an all-dark film-studio treatment.
- Floating rounded navigation, compact brand presence, short menu and a high-contrast red/pink message action.
- Editorial serif headings with a clean sans-serif body. Rendered styles identify Cormorant-family headings and Plus Jakarta Sans navigation.
- Hero pairs an emotional proposition with layered portrait film cards, titles, duration indicators and sound controls. The media demonstrates the style instead of merely decorating the page.

- Rounded panels, restrained borders and soft shadows make the detailed content approachable.

Information architecture and conversion

1. Emotional wedding introduction and immediate conversation CTA.
2. Budget/date qualification before a lengthy sales conversation. The site publishes its own investment range; those figures do not apply to EVR.
3. Complete wedding stories rather than only isolated highlights. The wedding library offers a five-question matching experience, then event/tradition browsing.
4. Written delivery/process promises, named responsibilities and a detailed journey build trust before the final CTA.
5. Team, client stories, FAQs and repeated contact/quote entry points address uncertainty.

Quotation experience

The public builder page first shows an example itemised quotation, explains price drivers such as events, crew, albums and extras, then introduces a three-step journey. The initial step asks for names, WhatsApp, wedding date and city. The page describes minimum coverage rules and optional additions.

What this changes for EVR: a public quotation journey is an important reference signal. The client has not explicitly selected staff-only pricing. Show a customer estimate path in the concept and make its final production scope a decision, rather than silently removing it.

Adapt, do not copy

Use the principles of media-first storytelling, relevant wedding galleries, process clarity and explainable estimates. Do not copy their exact typography combination, headline, card artwork, family photographs, team details, customer app, OTP workflow, mandatory crew rules, delivery penalties, testimonials, price range or scale claims. EVR must supply its own operating commitments.

3. GCS: detailed design and journey analysis

Visual system

- Bright neutral first screen, cool blue highlights, bold sans-serif headlines and rounded pill-shaped actions.
- The mobile hero centres its proposition and stacks the main actions; a compact “More” menu reduces header density.
- The full homepage uses contrasting sections, larger type, motion/video-led work and a dedicated short-form content area.
- The rendered navigation and headings use Manrope-family sans-serif styling. EVR can follow the clarity and hierarchy without reproducing the identity.

Information architecture and conversion

1. Broad agency proposition with primary call-booking and secondary service discovery.
2. Service overview spanning creative and technology disciplines.
3. Approach/ethos followed by short-form reels and selected client work.
4. A separate technology capability section, then testimonials, client names/logos and business metrics.
5. Repeated project/contact actions and detailed footer navigation.

Relevant inner pages

The content-production page specifies planning, reels/campaigns/brand films, scripts, direction and editing, with a direct project action. The work index is organised around named clients with selectable project entries. The contact form qualifies name, brand, email, phone, industry, service, budget, timeline and project detail, and includes a processing-consent checkbox.

Adapt, do not copy

EVR should use the service clarity, reel-first portfolio treatment, project summaries and structured business brief. Do not advertise GCS's website development, AI agents, CRM, SEO, paid marketing or application services under EVR without confirmation. Do not transfer client logos, engagement claims, ROAS or campaign statistics. Budget/timeline choices should reflect EVR's business, not copied agency thresholds.

4. Reference-to-EVR mapping

Observed principle	EVR design decision	Boundary
Light editorial wedding presentation	Warm ivory wedding section, serif headline, original portrait-format artwork placeholders	Replace with authorised EVR films/photos before launch
Bold service-led agency presentation	Cool off-white corporate section, sans-serif headline, service accordion and reel cards	Production services only
Prominent quotation discovery	Persistent “Build an estimate” entry plus staff quotation studio	Public pricing and final rules require approval
Full stories and selected projects	Filtered wedding/corporate work, project-detail preview with scope and deliverables	No invented clients or completed project claims
Visible operations and trust	Brief → plan → shoot → edit/deliver timeline; FAQ	No unapproved delivery guarantees or penalties
Business qualification	Service, brand/project, timeline, budget discussion and brief	Demo forms do not transmit or save personal data

5. Revised sitemap and homepage layout plan

```
EVR PRODUCTIONS
├── Home: one umbrella brand, two clear service paths
├── Weddings: wedding films, photography, pre-wedding
├── Brands & Corporate: films, reels, YouTube, podcasts
├── Selected Work: filters + project detail
├── How We Work: agreed process and FAQ
```

```
├── Build an Estimate: customer-facing concept
├── Start a Project: structured enquiry
└── Quotation Studio: staff workflow demonstration
```

Homepage order	Purpose / layout
01. Rounded navigation	EVR identity; weddings, corporate, work and estimate. Mobile menu keeps actions accessible without horizontal overflow.
02. Light split hero	Original EVR promise on the left; overlapping portrait artwork/media placeholders on the right. Wedding/corporate actions have equal visibility.
03. Two service worlds	Warm wedding panel and cool corporate panel with relevant calls to action.
04. Selected stories / reels	Three relevant media cards with category, format and project details. No fake play buttons for missing media.
05. Production services	Short, expandable service descriptions inspired by agency service clarity, restricted to EVR offerings.
06. Process	Four transparent stages with no fabricated speed/quality guarantee.
07. Quote invitation	Explain the price drivers, then offer an estimate builder or a custom discussion.
08. FAQ and contact	Address service fit, deliverables and quote status. Add verified proof only once supplied.

6. Quotation scope: show both sides, confirm the final model

CUSTOMER-FACING CONCEPT

Build an estimate

Choose wedding or corporate → adjust shoot days/output requirements → view an indicative breakdown → request final confirmation. The prototype uses sample rates and avoids a lead gate to keep the presentation safe and simple.

STAFF WORKFLOW

Prepare the final quotation

Confirm the brief → select services → edit rates and quantities → apply agreed charges → save the issued rate snapshot → preview/export the PDF. Production authentication and database storage are not present in the demo.

Wedding rules should define event/day/session coverage, crew minimums, travel and optional deliverables. Corporate rules should define shoot duration, equipment, video counts, lengths, edit rounds, formats and extras. Complex briefs should request review instead of receiving a misleading automatic total.

> **Commercial correction:** the previously discussed INR 65,000 scope was for the website plus staff quotation system, not the richer public rules engine seen in the reference. Keep that baseline explicit. A provisional combined budget of INR 80,000–95,000 may be more appropriate if a public estimator, shared rate rules and saved estimates are added. This is a planning allowance, not a verified market rate or fixed offer. Confirm complexity before quoting.

7. Delivery plan and acceptance gates

Stage	Deliverable	Gate
1. Confirm scope	Approved service list, public/staff quote decision, price rules, pages and excluded features	Client accepts written scope before development
2. Visual approval	Homepage, wedding and corporate views, mobile navigation, quote flow and PDF direction	One coherent visual direction approved
3. Production build	CMS/content, accessible responsive pages, enquiry delivery, authenticated admin and rate persistence	Test account roles, real errors, storage and edit permissions
4. Quote rules and PDF	Shared server-validated pricing, quote versions, immutable issued totals, print-safe templates	Client-approved worked examples match to the rupee, including tax, rounding and custom-review cases
5. Launch readiness	Licensed assets, policy content, hosting, backups, error monitoring and staff handover	Mobile/device QA, enquiry delivery test, restored backup test and client sign-off

Provisional timing: 5–7 weeks for the earlier staff-tool baseline; approximately 6–9 weeks for the combined public + staff scope, subject to approved rules, media and feedback. This is not a delivery commitment.

8. Content and asset checklist

- EVR logo, contact information, service region and preferred brand tone.

- Approved wedding films/photos and corporate/reel/podcast examples, with permission to publish.
- For each project: category, brief, scope, deliverables and allowed client credit.
- Actual rate sheet, units, minimums, discounts, tax treatment and custom-quote conditions.
- Delivery/revision/cancellation/payment terms and who approves issued quotes.
- Verified testimonials and approved logos only. Omit unsupported metrics.

9. Deeper hero-motion study and V3 rebuild

The first card-spread effect did not reproduce the references' underlying interaction pattern. A second inspection measured the public DOM at multiple scroll offsets and captured desktop/mobile frames. These are browser observations, not source-code copies or backend claims.

Reference observation	Measured / visible behaviour	EVR response
The Big Day opening vs scroll scene	At 1440 × 900, the opening split hero was approximately 711px tall. The following scene used a viewport-height sticky stage inside an approximately 3960px scroll section in this test. At scroll 850 the image stack was compact; around 1400 it had spread around a statement; by 2200 explanatory content was visible; later came floating testimonial cards.	Use a real sticky stage and multi-phase timeline, not a small rotation while the hero leaves the screen. No copying of photographs, text, testimonials or exact coordinates.
GCS opening vs services	The opening hero was approximately one viewport high and moved out with normal scrolling. The major pinned interaction began in its service showcase around the next viewport, using active service navigation, large typography, changing copy/images and progress. The desktop service section measured approximately 10350px, much longer than a normal section.	Carry over chapter orientation and a clear service-choice ending. Do not attribute an expanding-video hero to GCS: that was not observed in this test. Do not reproduce its long eight-service scroll journey for EVR's two primary audiences.
Mobile behaviour	Reference mobile compositions changed substantially: narrower galleries, stacked content and a condensed GCS service layout.	Use mobile-specific gallery coordinates, vertically stacked choices and a shorter scroll distance. Do not scale down desktop coordinates blindly.

EVR's original scroll storyboard

1. **0–20%: intro to centre stack.** Clickable side cards swap with the front card while at the beginning. The opening copy exits as the media gathers.
2. **20–49%: expansion.** Six original illustrated media placeholders spread around an EVR-specific statement.
3. **50–61%: gallery exit.** Media travels outward and fades.
4. **56–72%: perspective.** Two original explanatory panels describe EVR's wedding and brand approach.
5. **70–86%: floating notes.** Creative-brief questions arrive with staggered movement. These are not fabricated client testimonials.
6. **83–95%: choose your world.** Wedding and corporate panels arrive; their links become interactive when visible.
7. **End: release.** The stage unpins into the regular homepage. Reverse scrolling retraces every phase and preserves the selected front card.

The V4 desktop sequence adds 330 small-viewport-height units of scroll distance; mobile adds 260. A permanent Skip intro control exits to the main services. The animation reads native scroll position through requestAnimationFrame; it does not intercept wheel/touch input or impose a scrolling speed. There is no perpetual frame loop.

Accessibility and fallbacks: reduced-motion mode removes the scroll runway and shows the initial static hero; no JavaScript also leaves the static hero usable. Invisible links are inert, the skip control moves keyboard focus to services, and changing the motion preference live restores a usable layout. Below the hero, existing short reveal/hover effects remain.

All visuals are original illustration placeholders. Actual EVR films or photographs are still required to achieve the photographic finish of the references. The motion preview is a real local browser recording. Measurements are from this test viewport and session, not fixed claims about every device or future version of the reference sites.

10. What the revised prototype proves

It demonstrates the revised light visual direction, a multi-stage pinned hero, two service identities, mobile navigation, portfolio filters/detail preview, process/FAQ, a sample public estimate path, the staff calculator and PDF. It does not prove a live backend, approved EVR pricing, video delivery, operational guarantees or a finished production platform.

11. User-supplied recording: full-homepage V4 expansion

A local frame-by-frame sampling of the supplied 53-second screen recording clarified that the request covers the entire homepage experience, not only the initial card stack. The video was not uploaded, and its photographs, team portraits, client names, reviews and source assets are not included in this package.

Visible in the recording	Original EVR demonstration
Selectable stacked media and an expanding gallery	Click/tap/keyboard card swapping, then a reversible six-card gallery.
Explanatory panels and floating review cards	Original wedding/brand perspective panels and clearly labelled creative-brief notes, not invented reviews.
Date-check entry point and portrait film cards	Validated date enquiry that carries into the form, plus genuine playback of original illustration samples. No live availability claim.
Written assurances and phone-led process	Proposed scope/schedule/feedback principles and a five-stage scroll-synchronised phone mockup. No real app, notifications or delivery service.
Team carousel	Three selectable pairs of production roles with placeholder portraits, not fictional employees.
Video testimonials, expandable copy and FAQ	Six labelled testimonial placements with illustrated demo playback and expandable placement guidance, followed by homepage FAQ.
Closing conversation/quote actions and organised footer	Existing estimate/enquiry routes and a grouped sitemap footer. No invented phone number, messaging endpoint or legal policy.

Media behaviour: lower-page videos load only after an explicit play action. Starting another preview stops the previous one; closing restores focus, scrolling it out of view pauses playback, and route changes stop all previews. The two short H.264 samples are generated

from this project's original illustrations and visibly labelled as demonstrations.

Commercial boundary: the previous section-order table records the earlier V2 direction; this V4 mapping supersedes it. Existing indicative budget ranges are not a fixed offer for every recorded feature. Confirm animation/performance scope and real content requirements before quoting. A production client portal, app, notifications, live availability and booking integrations remain separate work.

12. GCS-led Brands & Corporate expansion / V5

A fresh rendered-page inspection on 7 October 2026 sampled the GCS homepage at 1440 × 900 and 390 × 844. Desktop screenshots and scroll-position measurements distinguish the ordinary opening hero from the long pinned services scene. This is a study of public visual behaviour, not a source-code reproduction or verification of the agency's results.

Observed GCS pattern	Original EVR corporate response
Bright neutral opening, bold sans-serif proposition, blue actions and portrait hero video.	Original EVR headline and blue corporate accent, a framed illustration-based showreel sample, and a small scroll-linked tilt. The opening itself is not pinned.
Desktop services start around scroll 900. The sampled section is approximately 10350px high, with a 900px sticky stage, persistent service list, passing artwork, changing description and progress.	Four production services rather than eight unrelated agency services. A sticky stage with continuous artwork translation/rotation, selected-service copy, native-scroll progress, selectable service buttons and a Skip services control. Extra travel is 240svh on desktop and 180svh on mobile, intentionally shorter than the reference.
Approach presented in an asymmetric grid of editorial, video, process and metric cards.	Original brief, direction, delivery-format and edit-timeline artwork. No imitation client results, project counts or growth graphs.
Portrait reels flank a central proposition, followed by a selected-work grid.	Two explicit-play portrait demos with gentle scroll-linked rotation; three portfolio-layout cards opening example briefs and deliverables.
Technology capability, testimonials, client logos, impact figures, FAQ and project enquiry.	A production-only workflow feature instead of technology claims; an honest client-story placeholder rather than fictional proof; relevant production FAQ and links into the existing enquiry and estimator.
Mobile condenses and rearranges the desktop presentation.	Centred hero, compact two-column service controls, smaller artwork beside readable copy, stacked approach/work layouts and shorter native-scroll travel. Below 740px phone height or 700px desktop height, the pin is removed so the content stays reachable.

Behaviour and accessibility

The scene is calculated from native scroll position and reverses with upward scrolling. It uses one queued animation-frame callback rather than a perpetual loop, and does not intercept wheel or touch input. Off-screen service panels are inert and hidden from accessibility APIs while the current service remains reachable. Button activation seeks the same scroll position; Skip services moves focus beyond the pin. Reduced-motion mode removes the runway, clears decorative motion and exposes all four services. Existing quotation calculations and homepage choreography remain separate.

Media and commercial boundaries

The four service posters and two additional portfolio compositions are original CSS artwork. Corporate video placements reuse the project's clearly labelled local illustrated motion sample until EVR supplies approved footage. No automatic playback, publishing, private uploads or real enquiry transmission is added. GCS's branding, photography, team, client names, quotations, endorsements and outcome claims are not used. Website development, AI systems, SEO, paid advertising and ongoing social management are not assumed EVR services. This additional animation work must be included explicitly when finalising production scope and budget.

Quotation reference: detailed functional adaptation

Latest decision: no customer-facing prices. The user subsequently requested all pricing be discussed on a call. Both quick and detailed public planners therefore collect requirements only. Their screen summaries, enquiry hand-offs and printed request PDFs contain no calculated prices, rates or totals. The detailed rate editor and its rate data have been removed. Any priced-public-estimator descriptions below record the earlier design direction and are superseded by this requirement. The separate original staff-workflow demonstration is unchanged and is not a protected production system.

The locally supplied DR Photography HTML includes event selection, day/session planning, crew quantities, pre-wedding flat packages, deliverables, a quotation preview/PDF and a price-editing panel opened by rapid logo clicks. The original EVR concept implemented only the simplified estimator and staff quotation workflow. It now adds separate detailed wedding and corporate planners, using original EVR UI and the shared branded print document rather than importing the reference logo, embedded artwork, code or external PDF dependencies.

Wedding planning covers event-specific days, dates, sessions, crew, equipment, packages and deliverables. Corporate planning uses production formats, day-level crew/kit, edits, delivery aspect ratios and intended usage. Wedding illustrative rates draw on the supplied reference; corporate rates are assumptions, not approved business pricing. Neither free raw footage nor confirmed package inclusions are inferred from the reference.

A context-aware bottom-right public CTA opens the relevant detailed planner and moves keyboard focus to it after route navigation. Quote, enquiry and staff pages hide this control. Staff price configuration is explicitly labelled as a tab-local demonstration in the studio, not hidden behind logo clicks or represented as authentication. The two detailed forms keep independent in-tab state, and catalogue edits affect only their corresponding detailed form. Browser reload clears this state and restores sample rates. Existing quick-estimate and staff draft behaviours remain unchanged.

13. Full dedicated menu pages / V6

The user selected full dedicated pages for every menu item, rather than section links within the two landing pages. The research was extended to the rendered wedding library, process and quote-builder pages on The Big Day, plus GCS services, work and about pages.

Evidence boundary: the three Big Day inner URLs returned HTTP 404 responses in this session but rendered substantial page content in the browser. A simple text fetch therefore did not represent the visible page. Their observed headings, controls and sticky layout were used as design evidence only; no enquiry or lead-gated quote step was submitted. GCS's inner-page content was inspected after JavaScript rendering. Public claims, prices and operating promises were not independently verified.

Reference insight	EVR implementation
The wedding library emphasises complete stories and matching a visitor to relevant work, not only highlight reels.	A dedicated wedding story library, wedding-day/pre-wedding/celebration filters, featured story layout and example project briefs. No reference weddings, names or photographs copied.

Reference insight	EVR implementation
The process page covers planning, responsibilities, editing, client-facing screens, terms and frequent questions, with several sticky story sections.	A five-stage native-scroll planning journey, responsibility cards, review/usage questions and FAQ. No invented staff, live app, penalties or fixed delivery dates.
The quote page explains the drivers behind the number before presenting an interactive builder and scope rules.	Separate wedding and production quote pages with price-factor sections, sample calculator, scope exclusions and review guidance. Existing calculation and enquiry transfer are reused; no reference crew minimums or prices are assumed.
GCS services present connected service layers; work is organised around selectable client projects; about explains purpose and principles.	Dedicated four-format production services, an independent brand portfolio and a four-stage production approach. EVR's scope remains filmmaking/content production, not GCS's complete marketing and technology offering.

Original motion system

Four reusable chapter scenes provide scroll-synchronised artwork, chapter highlighting and progress. Desktop artwork moves vertically; mobile artwork moves horizontally so it cannot pass behind the reading copy. Reverse scrolling restores the sequence. Direct controls seek the same native-scroll positions, and skip controls move keyboard focus beyond the scene. Hidden panels are inert. At heights below 820px on phones or 760px on larger screens, and whenever reduced motion is requested, all chapters are shown as ordinary readable sections. Decorative media drift, underline progress and section reveals provide lighter movement on the other pages.

Routing and quotation consistency

The menu now routes to Weddings, Selected work, Our process and Wedding estimate on the home side; Services, Our approach, Brand work and Production quote on the corporate side. Each destination has a fixed experience identity, with active-page navigation. The quotation UI is a single shared component mounted into the current quote page, with the same validation, rates and enquiry transfer as before. Portfolio filters are scoped to their own page, so selecting a brand category cannot change the wedding selection.

Commercial update: V6 contains 12 route views in total. Earlier eight-page pricing examples are not a fixed quote for the expanded website. Real content, final rates, authenticated staff access, persistence, booking, payment and messaging still require separate agreement and implementation.
